Project Overview

- Work explores:
 - the potential for integrating data rescue activities into the classroom;
 - the ability of students to produce reliable transcriptions and;
 - the learning benefits for students.
- Transcribe ~1300 annual rainfall sheets relating to 45 stations across Ireland.
- Each student (142 students) given 18 sheets - double keyed for QA.
- Excel template provided by Met Éireann.
- 274 sheets previously transcribed (single keyed) by Met Éireann.
- 3 Steps:
 - (1) Receiving the data (Dropbox)
 - (2) Transcribing the data (Excel)
 - (3) Returning the data (Moodle)

Form No. 1 METEOROLOGICAL OFFICE BRITISH RAINFALL ORGANIZATION.
REGISTER OF RAINFALL IN 1920.
 Report on *Royal Victoria Barracks* in the County of *Dublin* by *W. H. D. O'Connell*
 Station No. *224* Height of top of Gauge above Ground, *1.5* ft. Sea Level, *5.5* ft.
 Time of Observation, *8.00*
 Nearest Railway Station, *Dublin City Centre*
 Diameter of Funnel of Rain Gauge, *8* in.
 Diameter of Mouth of Gauge, *8* in.
 Height of top of Gauge above Ground, *1.5* ft. Sea Level, *5.5* ft.
 If an Observer prefers not to conform to the above suggested form, he is at liberty to use his own form, but must state the nature of the deviation in the margin of this paragraph. Full instructions for the measurement of rain, the selection and placing of rain gauges, and particulars as to the British Rainfall Organization are given in "Guide to Rainfall Observations" sent post-free on application to THE SECRETARY, British Rainfall Organization, 48, Cannon Square, London, W.C.1.

Project Overview – student supports

- Motivating Students –section of module devoted to the importance of historical climatology.
- Met Éireann gave a talk to convey the scientific, cultural and social importance of the data.
- Step by step written instructions
- Video tutorial
- QA check
- Check-in clinic - FAQ
- Class Discussion Forum

Re: Continuous Assessment Questions and Answers

by [SEAN O KANE](#) - Monday, 7 November 2016, 9:16 PM

Hi Ciara,

I'm having trouble making out the observer's name on Image number 6281.

Thanks in advance.

Sean.

Re: Continuous Assessment Questions and Answers

by [CIARA RYAN](#) - Tuesday, 8 November 2016, 10:00 AM

Hi Sean

The observer was Thomas Jackson.

Ciara

Re: Continuous Assessment Questions and Answers

by [SUZANNE O CALLAGHAN](#) - Wednesday, 2 November 2016, 7:55 PM

Hi Ciara

In relation to form 5 image 6055 for the monthly total in december I am getting 5.85 but 5.75 was recorded. If you wouldnt mind taking a look at it.

Thank you,

Suzanne.

Re: Continuous Assessment Questions and Answers

by [CIARA RYAN](#) - Wednesday, 2 November 2016, 11:14 PM

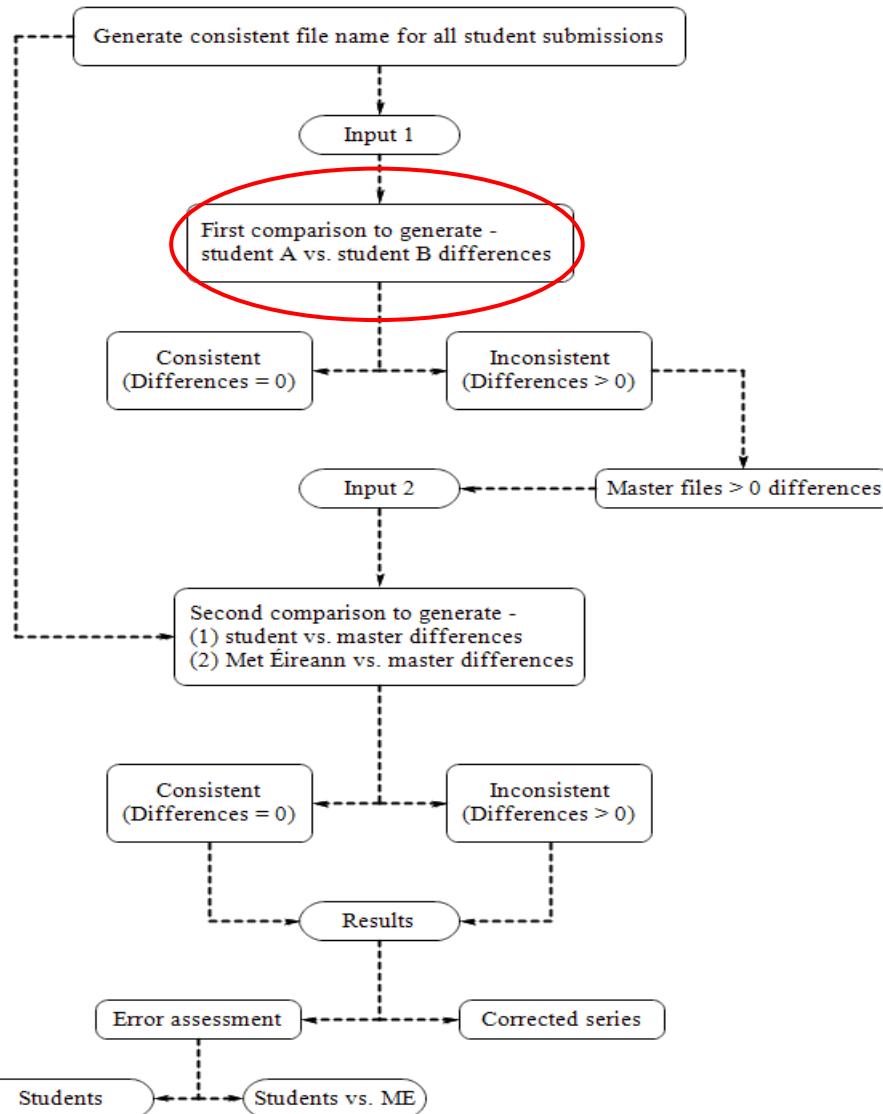

Hi Suzanne,

I'm getting 5.85 too so you can use this as your total for dec and adjust the yearly total accordingly.

Ciara

Evaluating student performance

- Compare double keyed sheets.
- Create a master “correct” data file by examining highlighted differences.
- Run the comparison again to evaluate student performance.

The screenshot shows a Microsoft Excel spreadsheet with a comparison of data between two sheets. The spreadsheet has columns A through U. The first column (A) contains metadata such as 'doc_no', 'image_no', 'station_name', 'station_no', 'station_lat', 'station_lon', 'year', 'start_month', 'start_day', 'county', 'funnel_diameter', 'gauge_height_ft', 'gauge_height_in', 'elevation_ft', 'yr_total', 'yr_rainday', 'yr_wetday', 'Jan 1 following', 'train_station', 'train_dist_miles', 'train_direction', 'gauge_pattern', 'observer', 'time_of_obs', and 'comments'. The second column (B) contains the corresponding data values. The third column (C) contains the difference between the two sheets, with a red box highlighting the value 0.15 in row 13. The fourth column (D) contains the difference between the two sheets, with a red box highlighting the value 0.15 in row 13. The fifth column (E) contains the difference between the two sheets, with a red box highlighting the value 0.15 in row 13. The sixth column (F) contains the difference between the two sheets, with a red box highlighting the value 0.15 in row 13. The seventh column (G) contains the difference between the two sheets, with a red box highlighting the value 0.15 in row 13. The eighth column (H) contains the difference between the two sheets, with a red box highlighting the value 0.15 in row 13. The ninth column (I) contains the difference between the two sheets, with a red box highlighting the value 0.15 in row 13. The tenth column (J) contains the difference between the two sheets, with a red box highlighting the value 0.15 in row 13. The eleventh column (K) contains the difference between the two sheets, with a red box highlighting the value 0.15 in row 13. The twelfth column (L) contains the difference between the two sheets, with a red box highlighting the value 0.15 in row 13. The thirteenth column (M) contains the difference between the two sheets, with a red box highlighting the value 0.15 in row 13. The fourteenth column (N) contains the difference between the two sheets, with a red box highlighting the value 0.15 in row 13. The fifteenth column (O) contains the difference between the two sheets, with a red box highlighting the value 0.15 in row 13. The sixteenth column (P) contains the difference between the two sheets, with a red box highlighting the value 0.15 in row 13. The seventeenth column (Q) contains the difference between the two sheets, with a red box highlighting the value 0.15 in row 13. The eighteenth column (R) contains the difference between the two sheets, with a red box highlighting the value 0.15 in row 13. The nineteenth column (S) contains the difference between the two sheets, with a red box highlighting the value 0.15 in row 13. The twentieth column (T) contains the difference between the two sheets, with a red box highlighting the value 0.15 in row 13. The twenty-first column (U) contains the difference between the two sheets, with a red box highlighting the value 0.15 in row 13.

Evaluating student performance -results

An evaluation of student performance revealed that:

62% of student transcribed sheets had no errors

In 96% of student sheets fewer than 5% of data entries were incorrect
i.e., 96% of sheets had < 20 errors

A review of all incorrect sheets reveals that:

52% of the sheets containing errors had fewer than 5 errors, 90% had fewer than 20 errors and only 3% had > 40 errors

Cumulative errors across all 2556 sheets transcribed by students reveals a percentage error of less than 1%

Empirical CDF showing the frequency (%) of student submissions being less than or equal to x, where x is the percentage of errors per sheet (top). Bar graph categorising the total number of incorrect sheets by actual number of errors per sheet (bottom).

Benchmarking student performance

An assessment of the 274 sheets transcribed by both Met Éireann and the students revealed that while the students have a smaller number of incorrect files overall (39% for students compared to 49% for Met Éireann), the majority (85%) of Met Éireann's incorrect files lie in the lowest error propensity category.

Different approaches to the transcription process i.e., row based or column based had an impact on the number of errors produced within individual files.

Benchmarking students: Evaluation of errors for common sheets ($n = 274$). Proportion of incorrect files by error category.

Evaluating the student experience

Learning outcomes were designed to provide students with:

- A first-hand experience of working with historical climate observations.
- A critical appreciation of the processes involved in data rescue, digitisation and quality assurance procedures that are essential to understanding past climate variability and change.
- First-hand experience of the powerful contribution that citizen science can make to the study of climatology, geography and other disciplines.

Student Feedback:

>90% gained insights into the process of data rescue and an appreciation of the role of historical data in climate research.

>90% could see value in their work and were motivated by the fact that they were contributing to research.

80% stated that they would prefer to participate in assignments like this over other, more traditional, assignments.

Next steps for the project:

- Delineate the margins of the columns and rows in the Excel template to reduce propensity for errors.
- Highlight the benefits of using the row based approach employed by Met Éireann.
- Create a metadata file for the students.
- Enhance the research experience offered to the students.

Next steps for the data:

- Application of comprehensive quality assurance techniques.
- Analysis of the long-term record to assess changes in the characteristics of extreme rainfall events.

Summary

- Over 1300 annual rainfall sheets and associated metadata transcribed by students.
- Performance of the students comparable to the professionals - percentage error $\sim 1\%$
- Positive feedback from students.
- Experience demonstrates the potential to extend this project to other universities.
- Project resources will be made available via maynoothuniversity.ie/icarus
